

SessionCraft

Workshop Booking & Capacity Management

Independent software project | Owner: Ismail Habib | Created September 2026

Actual application capture. Any example records are labeled verification inputs.

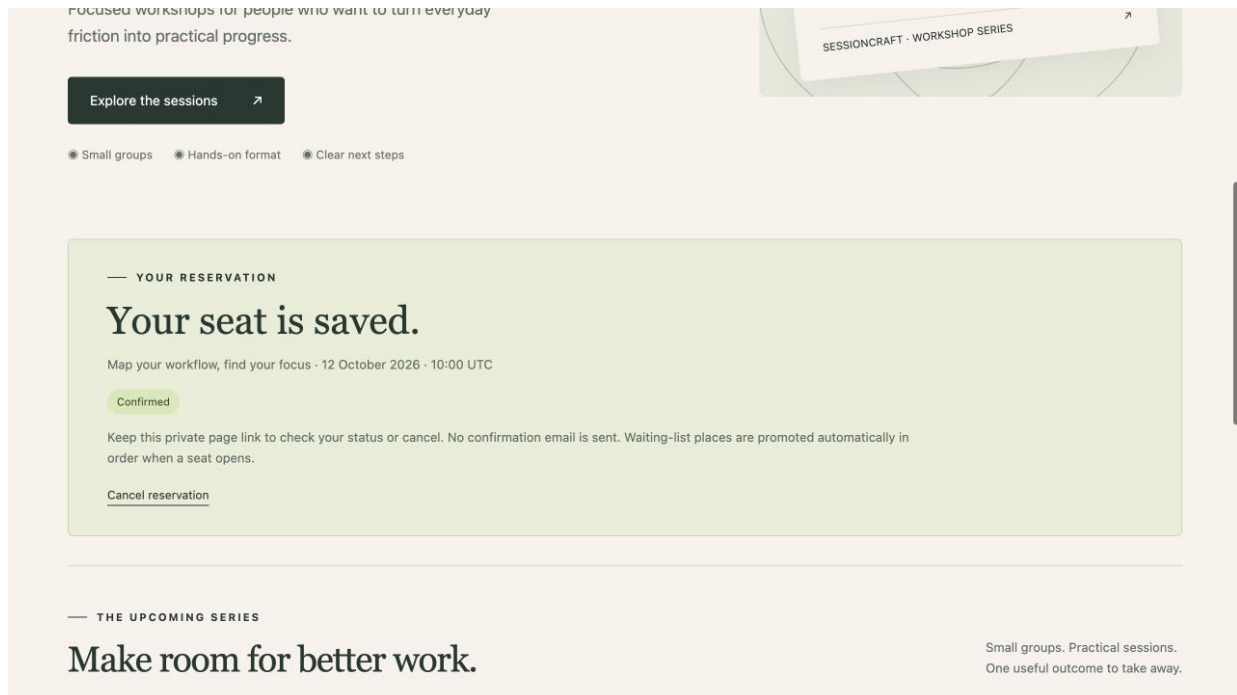

The problem

Small workshop organisers need to accept reservations without overselling seats, maintain a fair waiting list, and avoid managing cancellations in scattered messages.

What the project delivers

- Concurrent reservations with a locked capacity check
- Ordered waiting list with automatic promotion
- Private token-protected status and cancellation
- WordPress staff schedule and reservation management

Built to be inspected.

Actual persisted reservation confirmation with a private self-service cancellation link.

What was verified

15 live WordPress integration checks passed, including five concurrent booking attempts with exactly two confirmed seats at capacity two, FIFO promotion, duplicate rejection and cancellation-token validation.

How it works

Choose workshop to Reserve to Confirm or waitlist to Cancel to Promote next participant

Current scope

Locally verified independent project with an original fictional workshop programme. No payments, email notifications, public hosting or real client outcome claims. Schedule times are UTC; reservation details are stored locally.

Included: source code, setup guide, tests, screenshots, editable case study and Malt copy.
